Project Guide: - Kirtan Sanghvi

Bus pass Management System

By

Mr. Alfez Multani (003203191756)

Supervisor

PROF.KIRTAN SANGHVI (M.E.C.E)
Assistant professor, B.C.A Department,
C.U.Shah WADHWAN CITY.

A Project Submitted To Saurashtra University
October-2021

Shree C.U.SHAH
College of Commerce Management and Computer Education

Wadhwan City

CERTIFICATE

This is to certify that project entitle **"Bus pass Management System"** was carried out by **Mr. AlFEZ MULTANI (003203191756)** at **C.U. SHAH COLLEGE OF COMMERECE MANAGEMENT AND COMPUTER** for B.C.A 5th sem to be awarded by Saurashtra university. This project work has been carried out under my supervision and is to my satisfaction.

Date :-

Place :- wadhwan city

prof:- Kirtan Sanghvi. **Mr. H.k. Dave**

Assistant professor, **Principal, C.U. SHAH**
B.C.A Department **Wadhwan**

PROJECT APPROVAL

This is to certify that project work embodied in this project entitled " **Bus pass Management System"** was carried out by **ALFEZ MULTANI. (003203191756)** at **C.U. SHAH COLLEGE OF COMMERECE MANAGEMENT AND COMPUTER** is approved for 5th Sem to be award by saurashtra university.

Date: -

Place: - saurashtra university, Rajkot.

Examiners

DECLARATION OF ORIGINLITY

We here by certify that we are the sole authors of this project and that neither any part of project nor the whole of the project has been submitted for a degree to any other University or Institution.
We certify that, to the best of our knowledge, the current does not infringe upon anyone's copyright nor violate any proprietary rights and that any ideas, techniques, quotations or any other material from the work of other people included in our project, published or otherwise, are fully acknowledged in accordance with the standard referencing practices. Furthermore, to the extent that we have included copyrighted material that surpasses the boundary of fair dealing within the meaning of the Indian copyright (Amendment) Act 2012, we certify that we have obtained a written permission from the copyright owner(s) to include such material(s) in the current project and have included copies of such copyright clearances to our appendix.

We declare that this is a true copy of project, including any final revisions, as approved by project review committee.

Date:

Place: Wadhwan city

Name of Student:	**Name Of Guide:**
Mr. Alfez Multani	**Asst. Prof. Kirtan Sanghvi**

ACKNOWLEDGEMENT

I take this opportunity to express my gratitude and deep regards to my guide **Asst. Prof. Kirtan R. Sanghvi** (**C.U.SHAH COLLEGE OF COMMERECE MANAGEMENT AND COMPUTER**) for his exemplary guidance, monitoring and constant encouragement throughout the course of project thesis. The blessing, help and guidance given by him time shall carry me a long way in the journey of life on which I am about to embark.

I also take this opportunity to express a deep sense of gratitude to **Shree H.K.Dave** for his cordial support, valuable information and guidance, which helped me in completing this task through various stages.

I am obliged to all Faculty members of **UG** course **(BCA)** for the valuable information provided by them in their respective fields.

I am grateful for co-operation during the period of my assignment. Lastly, I thank almighty, my parents and all classmates for their encouragement without this assignment would not be possible.

Finally, I would like to thank all them who have directly or indirectly helped me in order to complete project work.

Mr. Alfez Multani.

ABSTRACT

BUS PASS MANAGEMENT SYSTEM

Prepared By

Mr. Alfez Multani.

Supervised By

Prof. Mr. Kirtan Sanghvi (M.E.C.E)

*This project is a web based online site. This is a Bus pass number site named "**Bus Pass Management System**. Basically, it is bus pass its provide bus pass system site.It has many facilities bus id registration has pass.This project has been developed into php & MySQL in backend. It has mainly 2 modules*

1.Admin

2.User

1.Introduction

1.1 Project Profile

Project Title	:	**Bus pass Management System.**
Team Size	:	01
Project Developer	:	Alfez Multani.
Definition	:	Easy to pass system.
Hardware Require	:	Pentium 4 Micro Processor or Above RAM 1 GB or Above Hard Disk 60 GB or Above
Software Require	:	**Platform :** Window 7or Above **Front End :** PHP **Back End :** MySQL **Report Tool:** MS Word
Project Guide	:	**Mr. Kirtan Sanghvi**

1.2 Project Summary

- This website is based on concept of Bus pass system.
- Bus Pass Management system is a web-based technology that will manage the records of pass which is issue by administrative and also help to provide online bus pass to people who need to travel daily

1.3 Project Purpose

Project Goals

- All the users i.e. users and admin will get the username and password to access the system.
- Admin will have the main authority admin can upload, modify and remove details.

Objectives

- The system will allow all the types of user to log in and see the data as per their level.
- It will have higher security level then the past system.
- It will reduce the time.

1.4 Scopes of Project

- The scope of the project is to provide Easy way to get a bus pass system.

2.Languages used for website

2.1 HTML

- HTML stands for hypertext markup language.
- With HTML you can create your own website.
- HTML is easy to learn.
- HTML is not programming language, it is a markup language.
- A markup language is set of markup tags.
- HTML uses markup tags to describe web pages.
- HTML tags normally comes in pair like and
- The first tag in pair is the start tag and second tag is end tag.
- Start tag & end tag are also called opening tag and closing tag.
- <HTML> tag define document as web pages.
- <HEAD> tag defines document headings.
- <TITLE> tag defines title of web page.
- <BODY> tag contains all the text, images &etc which we want to put on the web pages.
- HTML document saved with " .html " extension.
- For create HTML document you write your code in notepad& then run your program in internet explorer / Google chrome .

Structure of HTML Document:

```
<html>
<body>
<h1>My First Heading</h1>
<p>My first paragraph.</p>
</body>
</html>
```

2.2 JavaScript

- JavaScript is the scripting language of the web.
- JavaScript is the world's most popular programming language.
- JavaScript used in billions of WebPages.
- JavaScript used to validate form and communicate with server.
- JavaScript is easy to learn.
- JavaScript is lightweight programming language.
- JavaScript is interpreted programming language.
- JavaScript is developed by Netscape Communication.
- JavaScript is client side scripting language.
- JavaScript supports all the major browsers like Firefox, opera, chrome.
- JavaScript can create variable, function, cookie and session.
- JavaScript can put dynamic text into HTML.
- JavaScript can read & write HTML elements.
- JavaScript can detect visitor's browser.
- JSON is the newer form of JavaScript.

2.3 CSS

- CSS stands for Cascading Style Sheet.
- Style defines how to display HTML elements.
- The <Style> tag used for CSS.
- External Style Sheet also stored in CSS file.
- The extension of CSS file is .css.
- CSS provide Class, Span ID, Layers, and Attributes. ➢ CSS 3 is the latest version in Cascading Style Sheet.

- CSS 3 provide grouping, floating, positioning, Navigation Bar, Image Gallery, Image Opacity, Media Types & Nesting.

2.4 PHP/MySQL

(i) PHP :-

- PHP is an acronym for "PHP: Hypertext Preprocessor".
- PHP is a widely-used, open source scripting language.
- PHP scripts are executed on the server.
- PHP is free to download and use.
- It is deep enough to run the largest social network (Facebook)!
- It is also easy enough to be a beginner's first server side language!
- PHP files can contain text, HTML, CSS, JavaScript, and PHP code.
- PHP code are executed on the server, and the result is returned to the browser as plain HTML.
- PHP files have extension ".php".
- PHP can generate dynamic page content.
- PHP can create, open, read, write, delete, and close files on the server.
- PHP can collect form data.
- PHP can send and receive cookies.
- PHP can add, delete, Modify data in your database.
- PHP can be used to control user-access.
- PHP can encrypt data.

(ii) What is MySQL ?

- MySQL is a database server.
- MySQL is ideal for both small and large application.

- MySQL support standard SQL.
- MySQL is free download and use.
- SQL stands for structured query language.

There are several MYSQL functions to run for PHP

(i) **PHP mysqli_connect() Function:-**

The mysqli_connect() function opens a non-persistent MySQL connection.

(ii) **PHP mysqli_close() function:-**

The mysqli_close() function closes a non-persistent MySQL connection.

(iii) **PHP mysqli_query() Function:-**

The mysqli_query() function executes a query on a MySQL database.

(iv) **PHP mysqli_select_db() Function:-**

The mysqli_select_db() function sets the active MySQL database.

(v) **PHP mysqli_error() Function:-**

The mysqli_error() function returns the error description of the last MySQL operation.

(vi) **PHP mysqli_fetch_row() Function:-**

The mysqli_fetch_row() function returns a row from a record set as a numeric array.

PHP Create a Database

The CTEATE DATABASE statement is used to create a database is MySQL.

Create a Table

The CREATE TABLE statement is used to create a database table in MySQL.

2.5 JQuery

- JQuery is JavaScript library.
- JQuery simplify java script programming.
- JQuery is easy to learn.
- JQuery is light-weight JavaScript function library.
- JQuery uses “$” sign to define JQuery.
- JQuery has rich set of methods.
- The main purpose of JQuery is making it much easier to use JavaScript on your website.
- JQuery is also extensible.
- Many big companies on web uses JQuery Like Microsoft, Google, IBM, etc.
- JQuery Functions:-
  - ✓ HTML element selection
  - ✓ HTML element manipulation
  - ✓ CSS manipulation
  - ✓ HTML event function
  - ✓ JavaScript effects and animation
  - ✓ AJAX

3.Project management

3.1 Project Development Approach

- Building up of database for the system.
- Creating a light weight and sleek design.
- Creating a logical flow for the system.
- Modularizing the system.
- Merging the modules to act as a whole system.

3.2 Project Plan

- Analysis of the system.
- Organizing the project
- Hardware and software requirements of the system
- Merging of the database with the modules.
- Implementation of the task e.g. login module, registration module, etc.
- Monitoring and reporting mechanism.

4.Risk Management

4.1Risk Management

- A risk is any unfavourable event or circumstances that can occur while a project is underway.
- Software is difficult in understanding. Lots of things can go wrong.
- So the objective of including this section is to identify risk that can be helping us to understand and manage uncertainty during the development of the project.

Risk Analysis:

- **Performance Risk –** The degree of uncertainty that the product will meet its requirements and be fit its intended use. As we are trainees, the performance risk is there in our project.
- **Cost Risk –** The degree of uncertainty that the project budget will be maintained. The cost of our project is already decided by management.
- **Support Risk –** The degree of uncertainty that the resulting software will be easy to correct, adapt and enhance. Client of this project is on different premises.
- **Project Risk –** Threaten the project plan. If project risk becomes real, it is likely that the project will slip and that costs will increase.
- **Technical Risk –** Threaten the quality and timeliness of the s/w to be produced.
- **Business Risk –** Threaten the viability of the s/w to be built. This is live project so there is no project risk.
- **Known Risk –** Are those that can be uncovered after careful evaluation of the project plan.

- **Dictable Risk –** Are extrapolated from past project experience. As we are trainees, there is no such experience.

4.2 Estimation

- **Effort Estimation:-**Development of such applications requires programming skills and sound knowledge in the PHP –MySqlwith various others functionalities and tools used with it. This includes file writing, generating reports, database handling, data manipulations, and other big small tasks. The estimated timing to develop such a system would be approximately 1 month.
- **Duration Estimation:-**We used the survey and analysis results given by the IBM Federal System Division and according to those results the total duration, D, in calendar months can be estimated by the equation $D = a * E^b$.

  Again determining the values of a and b the data about the project that has been performed in the past we get the equation

  $D = 2.3 * 12.64^{0.38} = 6.03$ Months

Cost Analysis :-

(1) Direct cost

(2) Indirect cost

Direct cost

- Indirect cost, the cost of the software's and toll are included. In our project we use WampServer which includes Inbuilt SQL function. **Indirect cost**
- In indirect cost, cost of manpower is included in requirement analysis, project development and training of the project given to the user.
- For requirement analysis I spend 10 days of time in starting of the project.

5.System Requirement

5.1 User Characteristics

The E-learning System is having 2 types of users.

1. Admin

- The admin is managing the whole website data.
- Admin can add pass managed system.
- Admin can add category managed & delete
- Admin has their username and password and they can also change his profile and able to change their password.

2. User

- They are the users of the system.
- They register themselves with the system.
- They can show home page.
- They can easily contact that manager.
- They can newly pass system available.
- They can view latest system.

5.2 Hardware& Software Requirement

1) **Hardware Configurations:**

- Intel 2.0 GHz Processor or Above
- 60 GB Hard disk
- 1 GB RAM

2) **Software Requirement:**

- **Platform**

  Windows 7 or Above

- **Tools& Technology**

  WampServer

  PHP & MySQL

- **Reporting Tools**

  Microsoft Word 2009

5.3 Constraint

- **Hardware Limitations**

This website work with the hardware defined or higher.

This website is available free to access for any user.

- **Reliability Requirements**

The main reliability requirement is the validation used. Without proper validation the system does not allow entering that value into the database. For e.g. in the User detail registration form any field cannot leave blank all data must be needed.

- **Safety and Security Consideration**

Security is assigned to the administrator who has all the rights and controls on the website. Everything is shown to them.

- **Dependencies and Assumption**

Each User has unique ID for complain.

Administrators have privileges to access databases but candidates cannot access it.

No one can enter the admin panel without having a login and password.

6.System Analysis

6.1 Study of Current System

- The main purpose of developing the online bus pass website is to provide easy to pass management anytime.
- This site is mainly focused on student's bus pass.

6.2 Requirements of New System

1. Functional Requirement: -

- **Administration:** It is the function of the person who has the authority to bring about any changes, decide what data should be there and what should not be the part of the project.
- **Material:** It is the part that provides the information about the streamwise material which is done by the project.
- **Services:** Services provide with the information about the various functions and the services offered and provided by the site which can be availed by the users.

2. Non-Functional Requirement: -

- **Portability:** This material can easily transfer from one place to another without any changes. So, the content can be used without much modification. Hence the website is highly portable.
- **Reliable:** The website is much user friendly. At many places the directions and the process has been put up to help the users understand easier and faster.
- **Security:** This website is secured to a greater extend. Though the admin and user enter their Id and Password, the user can never enter

the admin account. Certain important information is only visible and assessed by the admin only.

- **Extendable:** After the entire implementation of the website, if certain new ideas arise they are welcomed and can easily be included without much effort.

- **Interface: -**The website will be compatible on every Windows platform. Operating systems like Windows 11 will support it.

1) Platform **:** WampServer or XampServer.
2) Front End **:** PHP.
3) Back End **:** MySQL.

6.3 Feasibility Study

- Feasibility is the measure of how beneficial the development of an information system will be to an organization.
- A process by which we measure feasibility is called as the feasibility analysis.

The Feasibility analysis is categorized under four different types.

1) Operational Feasibility.
2) Technical Feasibility.
3) Schedule Feasibility.
4) Economic Feasibility.

(1) Operational Feasibility

- Operational feasibility is measures of how will the solutions work in the organization and is mostly student oriented.
- The problem is worth serving, as it would let the users view and download any type of their requirements. The solution would definitely work.

(2) Technical feasibility

- It is a measure of practically of a specific technical solution and the availability of technical resource and expertise.
- The analyst must find out whether current technical resources, which are available in the system is capable of handling the visitor's requirements or not.
- If not, then the analyst with the help of developers should confirm whether the technology is available and capable or not.

(3) Schedule feasibility

- Schedule feasibility corresponds to whether sufficient time is available to complete the project.
- **Factor considered:**
  1) Schedule of the project.
  2) Time by which the project has to be completed.
  3) Reporting period.

(4) Economic Feasibility

- Economic feasibility is a measure of cost effectiveness of a project or solution.
- For declaring that the system is economically feasible the benefits from the project should exceed or at least be equal to the cost of development.

- The cost spent in the making of the project is categorized into two parts:

1) Direct cost:

- This is in terms of money.
- Hardware (Computer)
- Software (PHP - MySql)
- System study

2) Indirect cost:

- This is in terms of labor or the manual work.
- Time spent in system analysis
- Managing time
- Referring other sources like the internet.

6.4 Requirement Validation

- This project contains the following validations:
- These validations include input validation for the members or the users while registration.
- At the time of Login, User-id & Password must be required.
- The email id should contain symbols like „@“ and „.“
- Compare validation is used to compare and confirm the password.
- Some fields are compulsory to be filled by the users.
- User connection is must for downloading anything.

6.5 Function of System

- This is a project named "Bus pass Management System", User can access the sites object by proper authentication to the website.
- It provides good security as main authority is admin.
- There are mainly two functions will work like as:

1. User Function

- User can register for bus pass system management. User can view bus pass .

2. **Administrator Function**

- Admin governs the whole system in our project.

6.6 Main Module of New System

There are two main modules of the software which are listed along as follows.

1) Admin
2) User

6.7 Selection of Hardware & Software and Justification

- **Hardware Requirement:-**
  - ✓ PC with 60 GB Hard Disk
  - ✓ 1 GB RAM

- **Software Requirement:-**
  - ✓ Window 7 to above
  - ✓ MySQL Database
  - ✓ WampServer or XamppServer
  - ✓ PHP

7.Data Modeling

7.1 DFD (Data Flow Diagram)

The DFD (Data Flow Diagram) is also known as bubble chart. It is a simple graphical notation to main hat can be used to represent a system in term of the input data to the system . Various processing carried out on this data, and the output data generated by the system. The main reason the DFD technique is so Popular is on the account of the fact that it is very simple formulism-it is simple to understand and use. A DFD model uses a very limited number of primitive symbol.

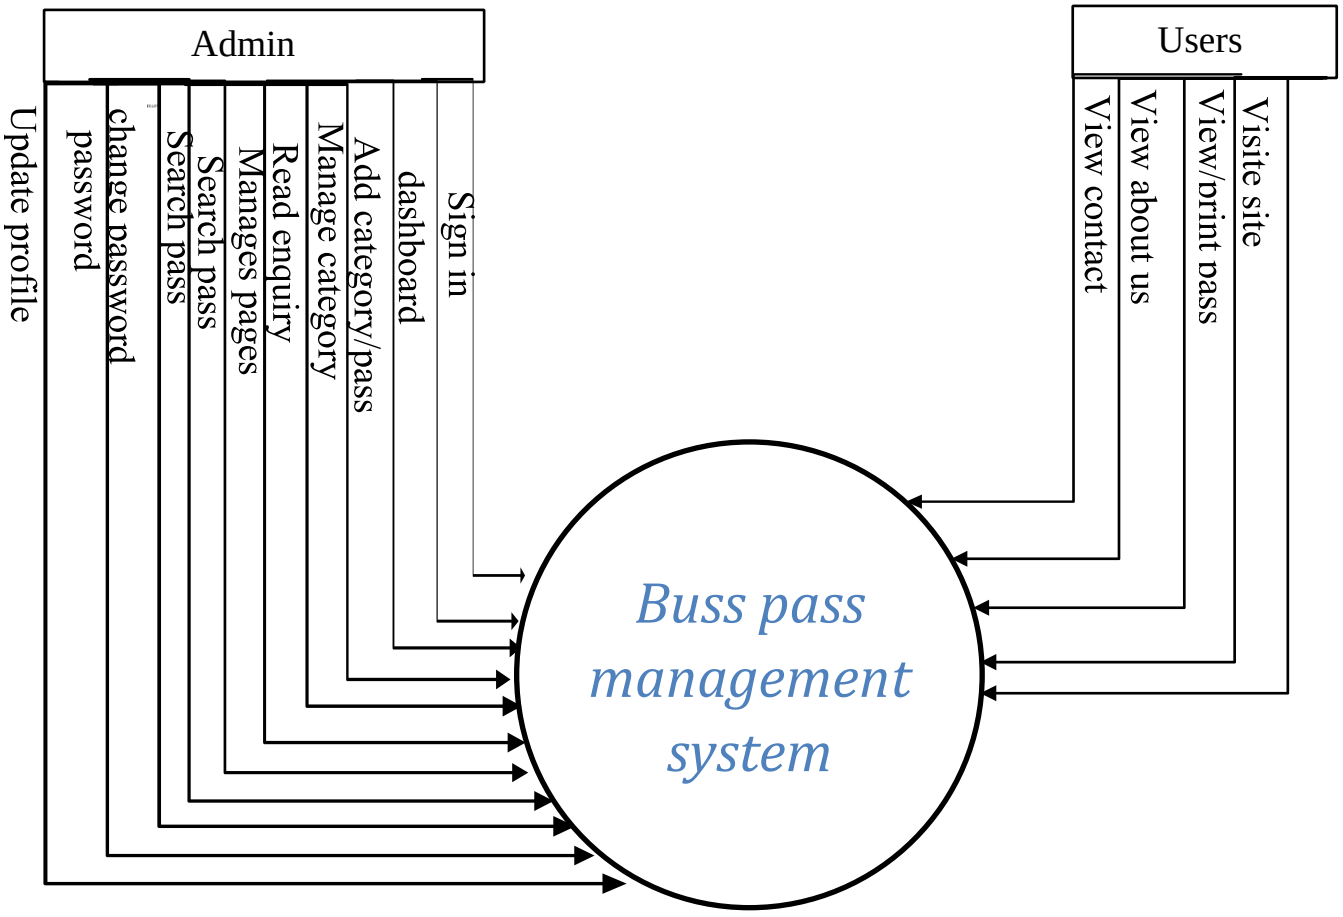

1.Data flow _____ **2. Process** 

3.Data Store _____ **4. Output** 

Data Flow Diagram (DFD) shows the data in to the system and processes and stores. Data Flow Diagram has two types.

- Logical Data Flow Diagram
- Physical Data Flow Diagram

Context Level Diagram:-

7.2 ER(Entity-Relationship) Diagram:-

E-R Diagram

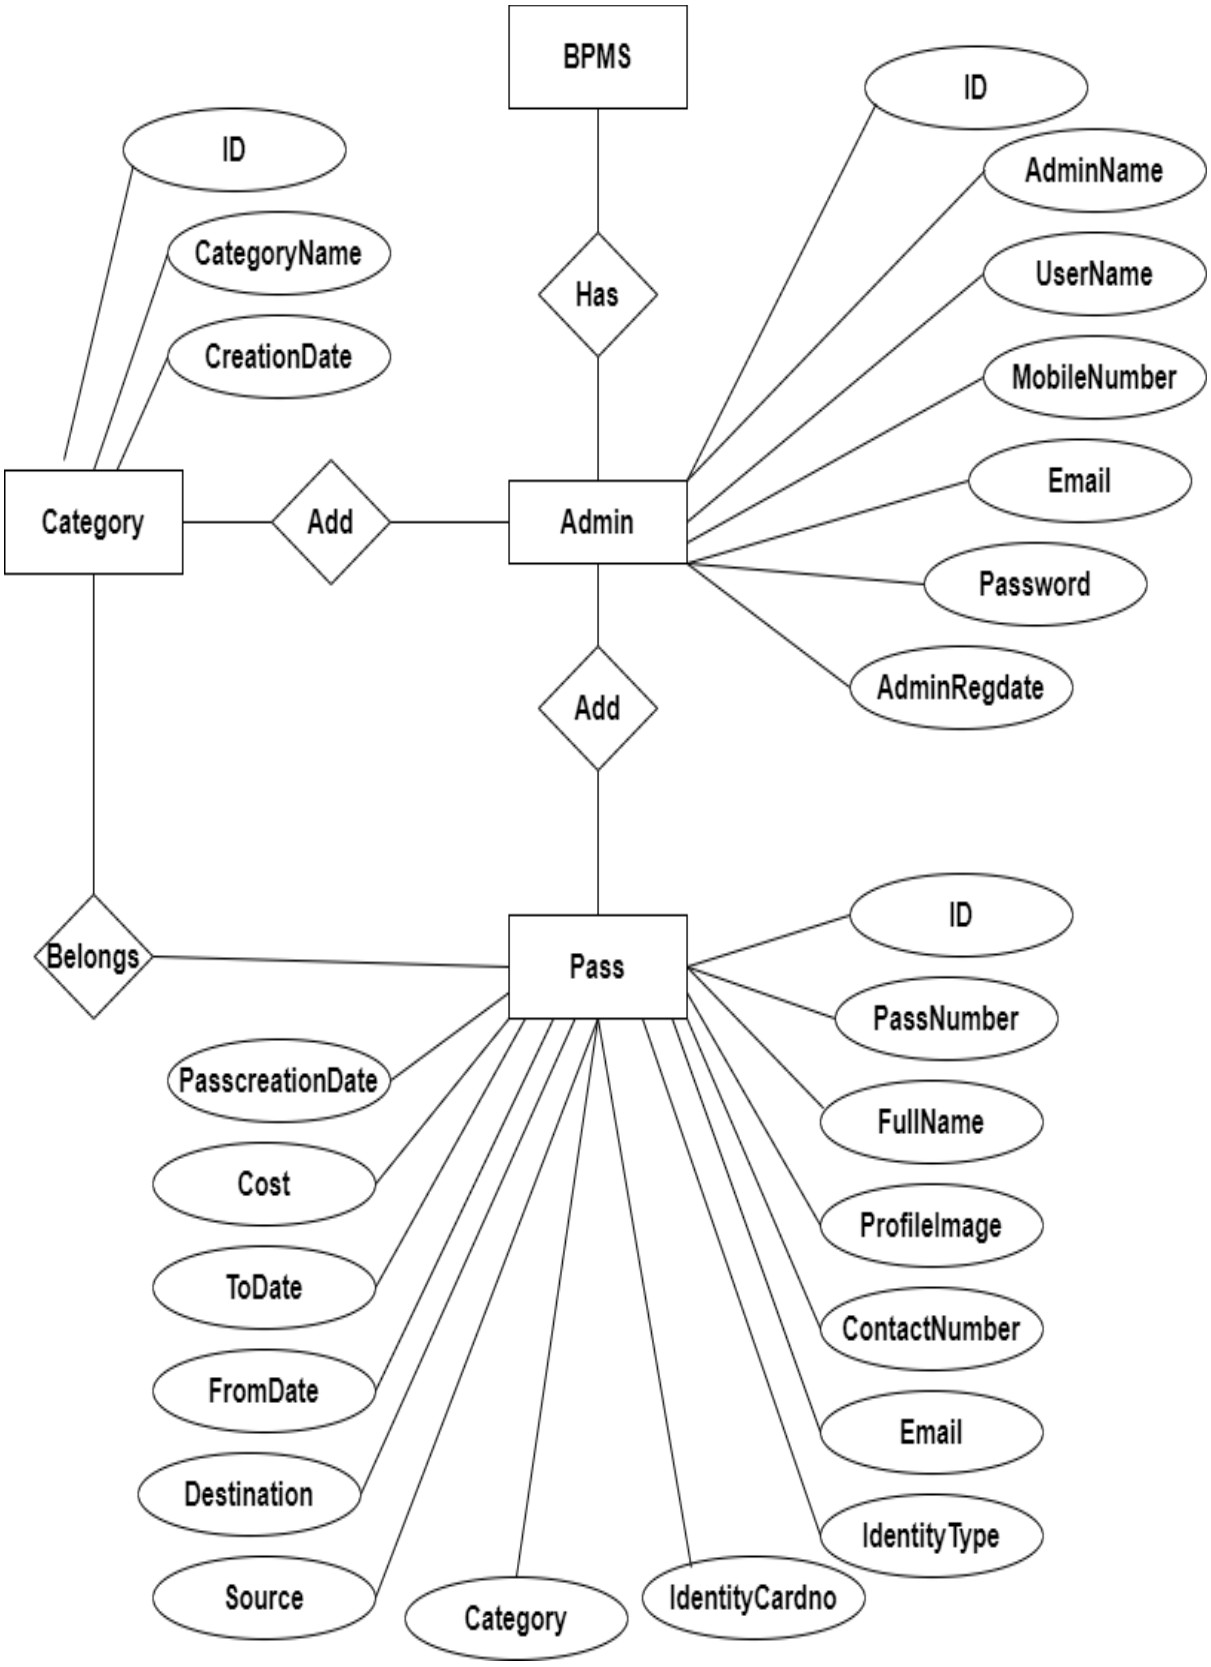

Diagrams are one of the better ways to communicate different of a components of a system. They are also too easy to understand by everyone. They offers an overview of the entries system. An E-R diagram is known as Entity relationship Diagram. An E-R diagram is graphical method of representing entity classes, attributes and relationship.

An ERD is a model that identifies the concept or entities that exits in a system and the relationship between those entities. An ERD is often used as a way to visualize a relational database: each entity represent a database table, and the Relationship lines represent the keys on one table that point to specific records a In related tables. ERDs may also be more abstract, not necessarily capturing every table needed within a database, but serving to diagram the major concept and relationship. This ERD is of the latter type, intended to present an abstract, theoretical view of the major entities and relationship needed for management of electronic resources. It may assist the database design process for an e-source management system, but does not identify every table that would be necessary for an electronic resource management database.

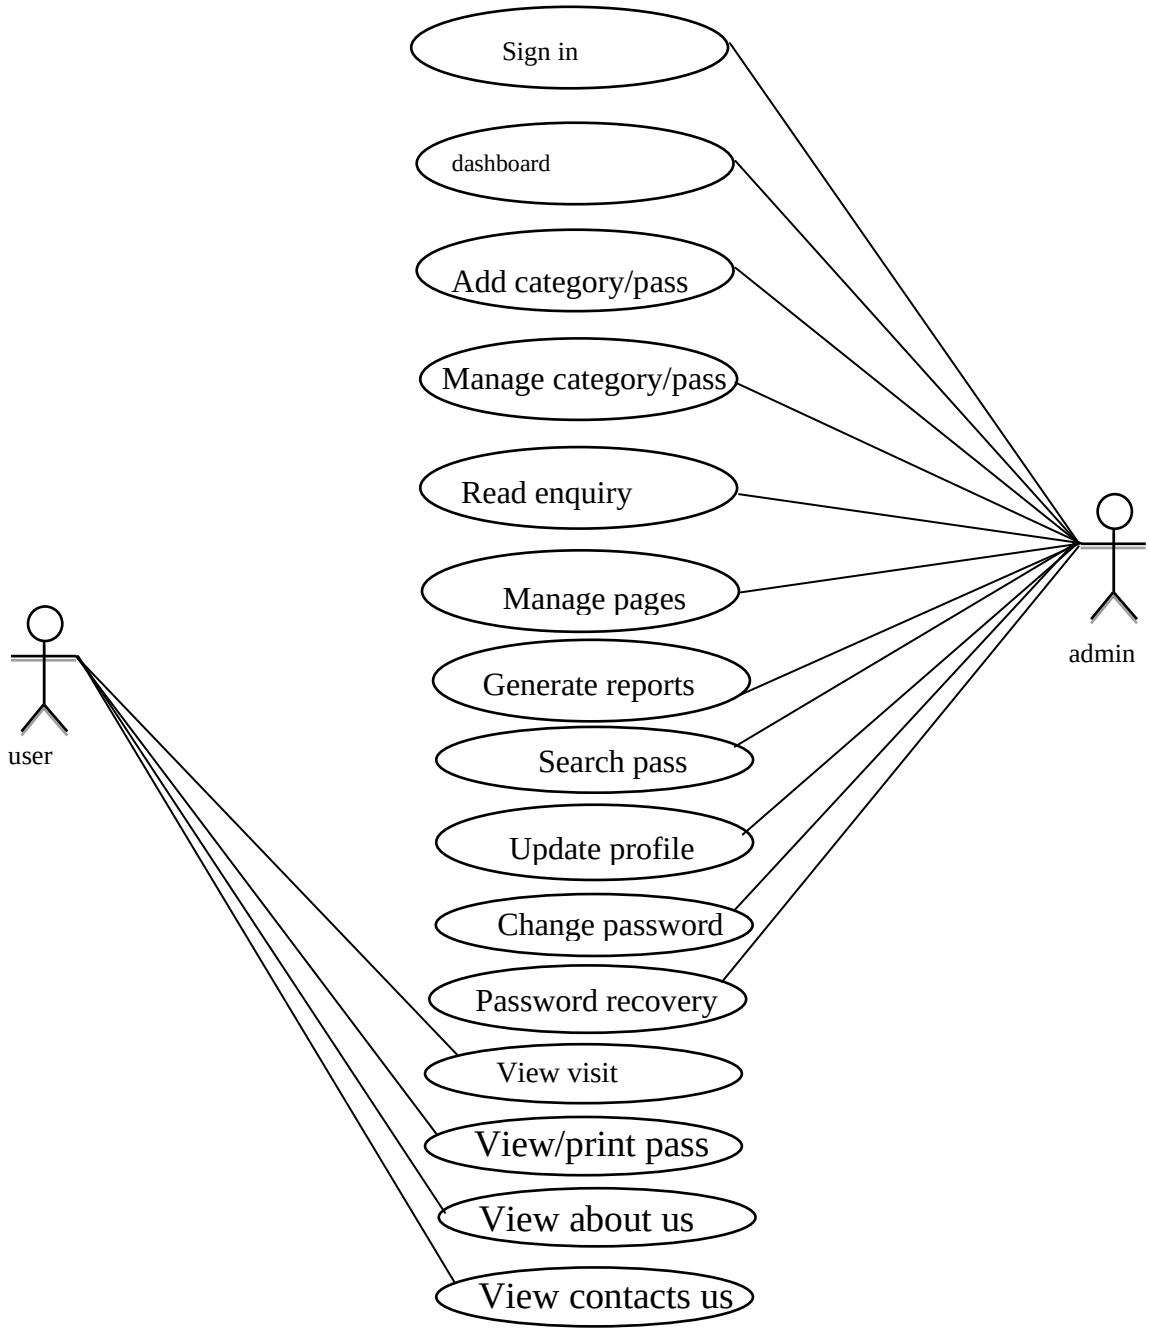

An E-R diagram uses six basic symbols:

1) A rectangle to denote an entity or entity set.
2) A diamond to denote a relationship between two entities.
3) An oval to denote attributes.
4) A ‘1’ to denote a single occurrence.
5) A ‘M’ to denote multiple occurrences.
6) A line which links attributes to an entity or entity set and entity sets to relationship.

10.Testing

10.1 Testing Plan

- A test plan is the cornerstone of a successful testing implementation.
- The testing plan represents the overall approach to the test. In many ways, the test plan serves as a summary of the test activities that will be performed.
- It shows how the tests will be organized, and outlines all of the tester's needs that must be met in order to properly carry out the test.
- The goal of test planning is to establish the list of tasks that, if performed, will identify all of the requirements that have not been met in the software.
- There are many standards that can be used for developing test plans.
- Early in the deployment planning phase, the testing effort, and identifies the methodology that your team will use to conduct tests.
- It also identifies the hardware, software, and tools required for testing and the features and functions that will be tested.
- A well-rounded test plan notes any risk factors that jeopardize testing and includes a testing schedule.
- So we can say that Test Planning details the activities, dependencies and effort required to conducting the system test.

10.2 Testing Strategy

- The test strategy is a formal description of how a software product will be tested.
- A test strategy is developed for all levels of testing, as required.
- The test team analyses the requirements, writes the test strategy and

reviews the plan with the project team.

- The test plan may include test cases, conditions, and the test environment, a list of related tasks, pass/fail criteria and risk assessment.
- The purpose of the testing strategy is to define the overall context for the entire testing process.
- The process is different depending on the specific characteristics of your solution.
- In many respects, this is the most important part of the testing process, since all future testing decisions will be made within the context of the strategy.
- As a programmer, we have to just do a unit testing which is a part of White Box testing.
- Other type of the testing in each phase of the software is done by testing department.
- Unit testing begins at the vortex of the spiral and concentrates on each unit (i.e. component) of the software as implemented in source code.

10.3Testing Methods

- There are mainly two strategies:
  1) Black Box Testing
  2) White Box Testing

1) Black Box Testing

- Black box testing is testing without knowledge of the internal workings of the item being tested. For example, when black box testing is applied to software engineering, the tester would only know the legal inputs and what the expected outputs should be, but not how the program actually arrives

at those outputs. It is because of this that black box testing can be considered testing with respect to the specifications, no other knowledge of the program is necessary. For this reason, the tester and the programmer can be independent of one another, avoiding programmer bias toward his own work. For this testing, test groups are often used. Also, due to the nature of black box testing, the test planning can begin as soon as the specifications are written.

- This strategy has some advantage like it is more effective on larger units of code than glass box testing, tester needs no knowledge of implementation, including specific programming languages, tester and programmer are independent of each other, and tests are done from a user's point of view, will help to expose any ambiguities or inconsistencies in the specifications, test cases can be designed as soon as the specifications are complete

2) White Box Testing

- White box testing strategy deals with the internal logic and structure of the code. White box testing is also called as glass, structural, open box or clears box testing. The tests written based on the white box testing strategy incorporate coverage of the code written, branches, paths, statements and internal logic of the code etc. In order to implement white box testing, the tester has to deal with the code and hence is needed to possess knowledge of coding and logic i.e. internal working of the code. White box test also needs the tester to look into the code and find out which unit/statement/chunk of the code is malfunctioning.

- The white box testing has also some advantages like as the knowledge of internal coding structure is prerequisite. It becomes very easy to find out which type of input/data can help in testing the application effectively. It helps in optimizing the code. It helps in removing the extra lines of code, which can bring in hidden defects.

10.4 Test Cases

- **Testing:** Software testing is a critical element of software quality assurance and represents the ultimate review or specification, design and code generation.

No.	Form Name	Purpose	Required Input	Expected Output
1	Login Page	To authenticate the person and to restrict some functionality to the guest user	Login id, Password	User should get rights to access the restricted functionality
2	Entry page	To validate all the fields of the personal information, so that can be given to users	Some Fields are mandatory	id would be generate and given to the user when in contact with each other for first time login

11.Conclusion and Future Work

11.1 Conclusion

- **'Bus Pass Management System'** has many powerful features and is certainly more than a "simple" diagramming tool.
- With its support of MDA (Model Driven Architecture), it is more aimed at people using UML in an intensive way and with some code generations objectives than for simply drawing diagrams to document requirements.
- However, using 'Bus Pass Management System' just as a diagramming tool work fine, especially on Windows as the tool is built with Delphi and might execute faster than the Java-based tools.
- Modern world is computer world where the things have to be done promptly that requires optimal resources and optimal methods.
- Our software simplifies and replaces all the manual effort and the paper works done by the administrative to a completely electronically environment. Hence both the user and the administrative are at their ease.
- The user is serviced at his footsteps wherein he just types in the request and he is just a click away.
- We would like to convey our sincere gratitude and thanks to all, who stood as our backbone, in designing, formatting and helping us in executing this project successfully.

11.2 Limitations and future enhancement

1 Limitations

- User can not directly pass without register.
- User can not directly pass number with out register.

2 Future Enhancement

- Pay only for 15 days, and used pass 30 days.
